

SebringSoft for SAP users

The key to improved ergonomics for your mySAP[™] solutions

The challenge

With the SAP NetWeaver initiative you are about to shift your IT infrastructure to a service oriented architecture for a better alignment with your actual business processes and an increased flexibility to face future challenges. Everything on that way is fine and you should consequently keep focus on these projects. But what about the frontends for involved users when service oriented methodology finds its way into your enterprise. The gained flexibility and efficiency on backend site should be answered by a new approach to ergonomic, flexible and system independent graphical user interfaces. In companion with SAP NetWeaver SAP brings up several new technologies to drive alternative user interfaces like Duet (former Mendocino), Adobe Forms, Enterprise Portal or Project Muse. They all have one idea in common:

- Uncoupling the user interface from application specific transactions
- Focusing on user specific roles and tasks
- Enabling system independent management of data

The main targets of these solutions for end users as well as the whole company are, to simplify the Usage, to simplify the Deployment, to simplify the Ownership.

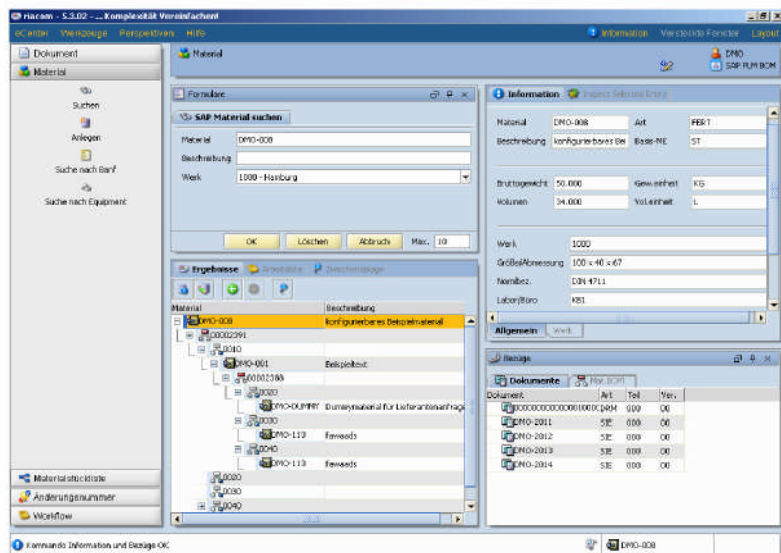

This approach works well as long as end users have very specific tasks to fulfill and there is no need to switch in between different SAP solutions or functional modules. Otherwise the user has to activate different frontends to fulfill his complete daily business, with each of these interfaces working ergonomically within their particular scope, but in total with a permanent change of methodology and behavior across the frontends.

So, what can be done for users with a broad scope of responsibility?

Keeping the well-known and universal SAP GUI as basic Rich client with all its restrictions in flexibility and ergonomics and with all its costs in deployment and ownership or using the SebringSoft solution.

The Java based client SebringSoft is particularly suited for SAP power users due to its uniform and ergonomically structured user interface. With its fully configurable desktop for various roles, its user specific functionality and the clearly arranged presentation of all needed information, SebringSoft is perfectly designed for even complex SAP activities, bringing the desired work result just within a few mouse-clicks.

The solution: SebringSoft

SebringSoft

SebringSoft: A new door to your mySAP™ solutions

The Java client supports all features of a modern user interface:

- Context sensitive menus and toolbars
- Active browser structures
- Reconfigurable window layout with dynamic close functions
- Undo functions, tool tips and look-ahead functionality
- Clipboard, Entry history and Result history
- Drag & drop operations within different internal views and external applications
- Quick personalizing of formulas and lists by simple mouse click
- Wizards and interactive user assistance for complex activities
- System independency to support enterprise wide work processes without breaks

By deploying SebringSoft clients, users can concentrate on accomplishing their proper tasks and select their individual way of managing objects and activating functions according to predefined business processes.

**Flexible configuration and
easy deployment**

The SebringSoft client fully supports already made configurations at involved SAP application servers. Predefined SAP user roles with their specific authorization profiles are reflected on role specific perspectives of the SebringSoft client management. Feedback by the called functions is immediately shown by presenting the original messages of activated transactions, of course in native session language.

Thanks to the progressive RIA (Rich Internet Application) technology with Java web start and the central client management the administration and update of clients gets very simple, even with individual personalization and role specific layouts.

SebringSoft communicates with the SAP application servers via a flexible adapter framework enabling also the integration of data from external legacy systems, on base of SAP NetWeaver XI or by a direct interface. This helps to build up the complete context of company specific business objects by including data not only from SAP applications but also from external systems, allowing to shift their migration to a later period.

SebringSoft – Your partner

SebringSoft is your project partner for integration solutions over the entire enterprise value chain. Our staff is distinguished by extensive experience in international projects, knowledge in the organization and improvement of business processes, in data modeling and system integration as well as extensive application knowledge.
