

Sebring Software

The New Software Generation Delivering Broad Solutions

The Problem

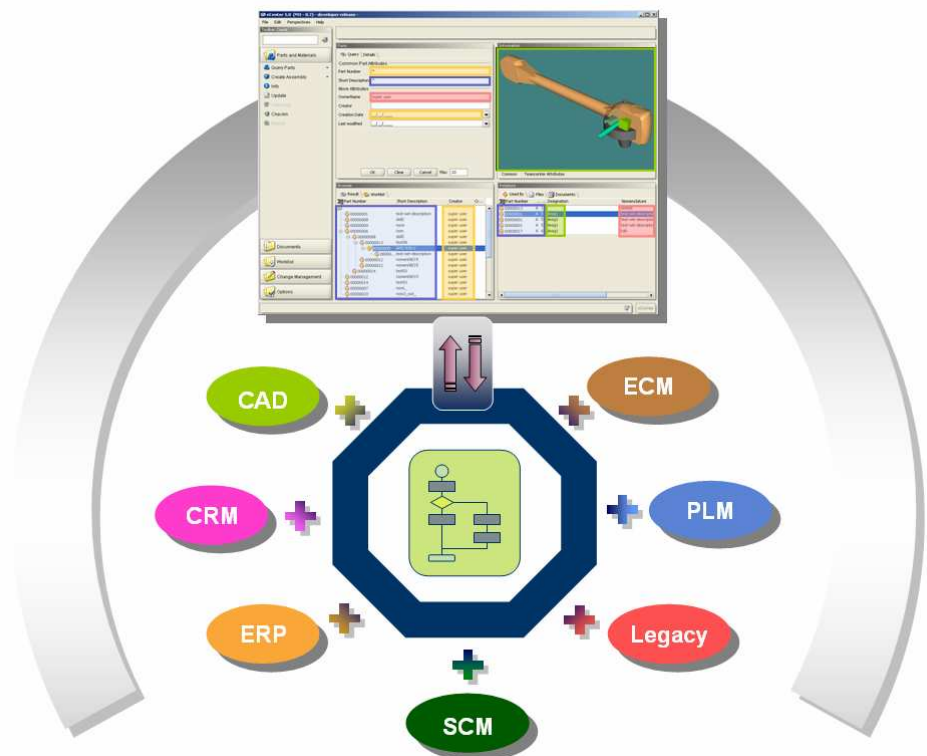

The number of IT systems implemented within the enterprise is constantly increasing... either by the introduction of new applications and procedures or by system growth caused by corporate mergers. The integration of these disparate applications is all too often a long-term endeavor.

Because enterprise data is dealt with in a variety of different application software systems, the end user is often forced to learn and work with a different user interface unique to each application package. Furthermore the user will be required to jump from package to package to update different data types.

The definite danger exists for data inconsistency caused by incomplete updates or non-synchronized procedures amongst the relevant IT systems. It is not uncommon for misunderstandings and wrong decisions to result.

The Solution

Sebring Software makes available to the user all connected volumes of data via one user interface based on the Java architecture. Thereby, all search, notification and data maintenance operations are provided in one common user view. *Sebring Software* automatically and transparently coordinates the required functions within the underlying applications. Furthermore, *Sebring Software* provides a very ergonomic and intuitive user interface which can be adapted easily to optimize workspace efficiency. Users at distributed locations as well as partners, customers and suppliers can access *Sebring Software* via network and Internet connections.

Sebring Software: The Key to Clarity and Efficiency

Applications

Fast-to-the-result with minimum mouse clicks -- instead of many pop-up windows and menu options -- by means of uniform prompting for all data.

By user-specific configuration of the before-generated user interface, all important information and functions are provided in the user's clear field-of-vision.

Completeness and consistency of the data are assured. *Sebring Software* thereby delivers functional integration of the applications and improved user efficiency.

Even data from difficult-to-access mainframe systems can be addressed by *Sebring Software* for fast decision making.

The smooth migration on new applications becomes possible, as often only slight modifications of the system-neutral user surface of *Sebring Software* are necessary.

Sebring Software spans the functional and data discrepancies between the involved applications.

The respective context is formed over key attributes of the relevant objects. *Sebring Software* links contents and meaning via XML structures and adapters between applications. The basis for enterprise-wide content management.

For direct "visual" integration on the data level (as with pure portal solutions), functional integration is added: the central process definition of *Sebring Software* provides for the update of data in the applications at the appropriate time.

Transaction processing with caching and rollback ensures data integrity and system stability.

Benefits

Sebring Software reduces redundant work during data and object administration.

Old applications need not be replaced, but instead can be integrated into the enterprise solution.

Avoidance of various point-to-point data interfaces by means of the universal adapter technology of *Sebring Software*.

Sebring Software – Your Partner

Competence

Sebring Software is your project partner for integration solutions over the entire enterprise value chain. Our staff is distinguished by extensive experience in international projects, know-how in the organization and improvement of business processes, in data modeling and system integration as well as extensive application knowledge.

Comprehensive Solutions

We offer consultation as well as design and implementation of integrated solutions, from the engineering through production, targeted at delivering business benefits to the enterprise.
